Abstract
Process Economics Program Report 283
BIO-BASED 1,4-BUTANEDIOL
(August 2012)

1,4-Butanediol (BDO) is an important compound that is used as a starting material for the production of important polymers such as polyesters, polyurethanes, and polyethers. The major uses are in the production of tetrahydrofuran (THF) (an intermediate for spandex and other performance polymers) and polybutylene terephthalate (PBT) resins for engineering plastics.

With the price volatility of conventional fossil fuel-based raw materials and an increased focus on technologies that reduce carbon footprint, there is an opportunity to deploy renewable bio-based technologies for the production of products like BDO. Currently, the majority of BDO installed capacity is based on the conventional acetylene-based process. Many companies are considering bio-based technologies for the production of chemicals with hopes of being able to use cheap sugars as a feedstock, thereby eliminating the need for fossil fuel-based feedstocks. Companies such as Genomatica, BioAmber, and Myriant have announced plans to develop processes to produce BDO from sugars or cellulosic feedstocks. The technologies either produce BDO by direct fermentation of sugars or by indirect routes involving bio-based intermediate (e.g., bio-succinic acid).

In this PEP report, we present process designs and associated cost estimates for producing BDO using both bio-based and conventional process technologies. The designs presented in this report are for a base case capacity of 30 kTA or 66 million lb/yr of BDO. The conventional technology presented is based on acetylene which is still the dominant method of producing BDO in the industry. Additionally, two competing bio-based technologies are presented in terms of process designs and the associated economics—BDO by direct fermentation of glucose and BDO by hydrogenation of bio-succinic acid which is obtained by fermentation of glucose. Process economics presented for these technologies include both capital costs as well as production costs, thereby enabling a direct comparison of the economics of these technologies.
BIO-BASED 1,4-BUTANEDIOL

IHS Chemical agrees to assign professionally qualified personnel to the preparation of the Process Economics Program's reports and will perform the work in conformance with generally accepted professional standards. No other warranties expressed or implied are made. Because the reports are of an advisory nature, neither IHS Chemical nor its employees will assume any liability for the special or consequential damages arising from the Client's use of the results contained in the reports. The Client agrees to indemnify, defend, and hold IHS Chemical, its officers, and employees harmless from any liability to any third party resulting directly or indirectly from the Client's use of the reports or other deliverables produced by IHS Chemical pursuant to this agreement.

For detailed marketing data and information, the reader is referred to one of the IHS Chemical programs specializing in marketing research. THE IHS CHEMICAL ECONOMICS HANDBOOK Program covers most major chemicals and chemical products produced throughout the world. In addition the IHS Chemical DIRECTORY OF CHEMICAL PRODUCERS services provide detailed lists of chemical producers by company, product, and plant for the United States, Europe, Asia, South and Central America, the Middle East, Canada and Mexico.
